

AREA OF A

*Two bases.
One height.*

TRAPEZOID

A trapezoid has exactly one pair of parallel sides, called the bases. Add the two bases, multiply by the height between them, then cut the result in half.

$$A = \frac{1}{2} \times (b_1 + b_2) \times h$$

where b_1 and b_2 are the parallel bases and h is the height

EXAMPLE

Base $b_1 = 10$ cm

Base $b_2 = 6$ cm

Height (h) = 4 cm

$A = \frac{1}{2} \times (10 + 6) \times 4$

$A = \frac{1}{2} \times 64 = 32 \text{ cm}^2$

The area is 32 cm².

REAL WORLD CONNECTIONS

- Bridge spans
- Retaining walls
- Tabletops and desks
- Lampshades

TWO BASES.
