

Say What It Compares

E L A + M A T H · W O R D S T U D Y

Mr. H Math · Day 20

WRITE YOUR NAME — one letter per box, straight and neat

Date: _____

Score: ____ / 10

Today the numbers are easy and the language is the test. Two classmates write two different ratios for the same bowl of apples and **both are right** — because they are comparing different things. A ratio without the two quantities named is only half an answer. Today you finish the sentence every time.

DO NOW · SILENT START

3 min

A bowl holds **4 green apples and 6 red apples**. Akiko writes **4 to 6**.
Bridget writes **4 to 10**. Circle who is right — then write what each one is comparing.

TURN & TALK

3 min

Take opposite sides with your partner and defend your classmate. You may only argue by naming quantities, never by saying “that’s just wrong.”

Frames: “Both are true because ____.” · “Yours compares ____ to ____; mine compares ____ to ____.”

Section A · Guess the Word

Fill in the blanks to find the word for each amount a ratio names.

Q U A N I Y

The SAME missing letter goes in both dashed boxes. Write it here: _____

A ratio compares two amounts. Each amount is called a _____ — say both, every time.

“The ratio is 4 to 6” is not finished. “The ratio of **green apples** to **red apples** is 4 to 6” is.

Section B · Meet the Words That Finish the Sentence

Use the word bank to complete each sentence.

quantities

part to part

part to whole

compare

- The two amounts a ratio names are its _____.
Example: green apples and red apples.
- To _____ is to say how two quantities are related, not how big one is.
Example: 4 green for every 6 red.
- 4 green to 6 red compares one group to another group: a _____ ratio.
Example: neither number is the total.
- 4 green to 10 apples compares one group to the total: a _____ ratio.
Example: 10 is the whole bowl.

Section C · Try It: Finish Every Sentence

A store sells 1 smartwatch for every 8 smartphones. Study how one situation produces three honest ratios, then do yours — and name the quantities on every line.

WORKED EXAMPLE

1 smartwatch for every 8 smartphones

whole = 1 + 8 = 9 devices

watches to phones = 1 : 8 (part to part)

watches to all devices = 1 : 9 (part to whole)

phones to all devices = 8 : 9 (part to whole)

“The ratio of smartwatches to smartphones is 1 to 8.” — full sentence, both quantities named.

YOUR TURN

A pack holds 2 blue pens for every 7 black pens.

whole = _____ pens

one part-to-part ratio: _____ : _____

one part-to-whole ratio: _____ : _____

Write each one as a full sentence that names both quantities:

REFINE · SUMMARY — A ratio is only finished when the two quantities are named. Part to part and part to whole can both be true of the same bowl, the same pack, the same room — so the check is never “is 4 to 6 right?” but “4 to 6 of **what**?” Next: two ratios that look different and are secretly the same deal.

☆ A ratio without its quantities is half an answer! ☆
